Editing tools for modifying the geometry are used to modify and create new objects. 3D objects may be created by extruding, by converting from a plane, or by rotating around a virtual axis or center of rotation. Objects may be placed by using the snap, alignment, and placement features. A variety of tools are available for construction of models such as walls, columns, beams, doors, windows, stairs, roofs, slabs, etc. The Direct Selection tool is used to select and modify the geometry on the drawing surface and is used to select individual entities such as points, lines, or polygons. The Command Line utility allows users to select, copy, move, or delete elements. The ruler is used to measure the lengths of lines and arcs, and to position objects and mark them for other functions such as cutting. The Arc and Circle tools allow the creation of arcs and circles, in addition to other basic shapes. Text is added to the drawing by using the Text tool.
