For Windows XP, InPage is available in the following languages.Q: Converting a string to an Uint8array I want to convert a string to an uint8array, but I can't find anything about it in the documentation. I have seen the WebSocketType.Text, but no mention of converting a string to an Uint8array, only in binary. A: Found it! The best way is to call createBuffer var buffer = new TextEncoder().encode(input); After that you can convert that buffer to a Uint8Array var bytes = new Uint8Array(buffer); A:

JavaScript's String has a method called bytes that returns an Uint8Array: `var txt = "Hello World"; var bytes = txt.bytes;` However, it is not binary as the MDN says. It is hexadecimal: 0x68656c6c6f And there is no official source for the conversion between UTF-8 (or UTF-16) and UTF-16BE or UTF-16LE. However, it can be calculated based on the source: source: UTF-8 -> UTF-16 (with 0x00 added in

forÂ . You can't export your keys.Q: How to modify the data while sending it to the server in android? I have a list of data(name-Id) to be sent to the server. The server only takes the ID and the name of the data. So I'm attaching the data to a notification and when a notification is clicked, I want to send the data along with the ID to the server. The above image is just a concept. The data is saved in a database. How can I send a complete package to the server (Name-Id) when I click a notification. PS. I cannot attach the data to a intent. A: Since Notification has the method to set the extras, you don't need to use a separate intent. Notification notification = new Notification(icon, msg,

```
time); notification.setLatestEventInfo(context,
title, msg, intent); //Create an Intent that will
    contain the extras Intent intent = new
        Intent(context, MainActivity.class);
        intent.putExtra("id", your_id);
intent.putExtra("names", your_names);
        PendingIntent pi =
PendingIntent.getActivity(context, 0, intent,
    0); notification.setContentIntent(pi); the
