films Erysipelothrix rhusiopathiae
osteochondritis.

Osteochondritis due to Erysipelothrix rhusiopathiae are rare. We report two cases of septic arthritis and one case of septic sacroiliitis. The first patient was a 52-year-old man with a history of alcohol abuse who presented with lower limb pain and swelling. The second patient was a 39-year-old man who presented with lower limb pain. The third patient was a 65-year-old man who presented with pain

in his left shoulder. He underwent multiple debridements of his wounds and had total hip arthroplasty. Osteoarticular infections caused by *E. rhusiopathiae* are characterized by the rapid onset of pain and inflammation followed by bacterial osteoarticular septic arthritis and bone and joint infections. The most common clinical findings are articular swelling, pain, and fever. The diagnosis is often difficult and delayed since the classical signs of septic arthritis, such as joint stiffness and lymphoedema are absent. The frequency of *E.*

rhusiopathiae infection has been increasing worldwide. There are few data on the treatment of bone and joint infections due to E. rhusiopathiae, but antibiotic therapy has been successful in most cases. The aim of this paper is to summarize the characteristics of E. rhusiopathiae osteoarticular infections and discuss the therapeutic options.
