

a data-driven approach to impact analysis date posted:wed, 02 nov 2018 03:01:28 -0500drawing on multidisciplinary research and field studies conducted in india, this working paper aims to measure the impact of two major state-level interventions on neonatal mortality and maternal and child health outcomes: the rashtriya swasthya bima yojana (rsby) and janani suraksha yojana (jsy). the methods developed for the analysis, particularly the conceptual framework, are specifically designed to assess the impact of these interventions on maternal and child health indicators. the baseline analysis is based on the comprehensive, nationally representative nths 4 data. the major findings from the analysis are as follows: a) infant mortality rate has significantly declined in the last few years. b) an increase of health expenditure from rsby and jsy has had a positive impact on these outcomes. a methodology is presented which establishes the threshold of rupees below which the government can set up solar plants. the methodology seeks to avoid errors in the estimation of the optimal number of solar panels: the analysis is applied to a two-year period in rajasthan during which the share of solar power generation rose from 3.9% in june 2018 to 25.2% in september 2018. this represents an increase of two-fold, with the majority of the growth attributed to the increase in the share of solar power generation of new projects. the cost of capital is about 16%, with the cost of finance increasing from 1.34% in june 2018 to 1.84% in september 2018. the total cost of solar power projects rose from rs 236.34 crore in june 2018 to rs 849.08 crore in september 2018. the analysis concludes that the government can set a threshold above which more solar power generating capacity can be set up, which can avoid the risk of overpricing and lead to the oversupply of electricity.
