Protect your files easily. Password encrypts documents, images, and video. Save extra space and bandwidth by automatically erasing the original file. Protect your files securely. Create password-protected ZIP files for zip files and more. A lot of people have trouble understanding the reason for the small file size of popular open source software such as Linux. In this article, we will explain the different types of compression used by Linux and their uses and why they are more efficient than just compressing the files directly, without any of the above types. Compression The reason compression is used to reduce the file size is because of the difference in the ways in which the data is compressed and compressed data are much smaller than the original data. Basically, compression is a technology that uses mathematical algorithms to reduce the size of data and optimize it, thus increasing the file size. Compression-Algorithm Different algorithms are used for different tasks. Data is usually compressed using compression algorithms such as LZ77, LZ78, LZW, 7-zip, etc. The following picture shows the compression techniques used in different compression algorithms. Types of compression There are many different types of compression that can be applied to compress data. LZ77 (Lempel-Ziv 1977) LZ78 (Lempel-Ziv 1978) LZW (Lempel-Ziv-Welch 1987) 7-zip (SevenZip) LZMA (Lempel-Ziv-Markov-Assouline) LZO (Lempel-Ziv-Oberhumer) LZO2 (Lempel-Ziv-Oberhumer 2) Types of compression There are various types of compression that can be used to compress data. The following table shows these compression methods: File size reduction The size of the compressed data can be reduced by a different means, for example, by rearranging the data. The benefit of compression is that it reduces the amount of time that it takes to transmit the data over the Internet. It is better than a large file as the data can be compressed and uploaded to the server faster. LZ77 (Lempel-Ziv 1977) LZ78 (Lempel-Ziv 1978) LZW (Lempel-Z
