Description: Flexbar is a command line tool that is designed to provide you with a flexible barcode detection and adapter removal utility. It works by storing the sequence data of the processed file in memory. Mapping rate increasing, filtering, trimming are just some of the available options. It can work with both FASTQ and FASTA files as input. Description: FeatureCounts, implemented in C, counts the occurrences of k-mers in a fasta file. It produces a tab-delimited file, containing a single row per k-mer and a count of that k-mer in the input file. By default, k-mers are limited to 11 bases long. If you change the k-mer size, it is useful to re-run the script. However, it is not necessary to re-run the script. If you want the k-mer counts for different k-mer sizes, you can use the -k option. The following command line parameters are available: -f fastaFile: FASTA file to be analyzed -k k-mer length (default: 11) -p original reference genome filename -o output name (default: out.txt) -d
