I would have been perfectly happy to end this review at this point, but unfortunately the last question brings us on to the downsides of Adobe's rightly popular image management and RAW converter tool. I did say Lightroom emphasizes speed, but perhaps clarifying this statement is in order. The emphasis on speed lies in the flexibility of available tools. For example, you can now do some advanced image "healing" with the updated Spot Removal tool and remove objects that are more complex than simple dots. And that saves you time working with Photoshop on the same image, which I personally appreciate very much. When it comes to the actual speed of operation, however, things haven't really changed for the better. Importing is, if anything, slightly slower. The same with Exporting, which also feels to be more sluggish than before. Use that brilliant Spot Removal tool too many times on too many photographs and you may experience lag when changing adjustments or moving from one image to another. Other obvious bugs and performance issues do not make a very good impression, either. Of course, complex Spot Removal shapes are bound to eat up those resources. After all, there is quite a bit of vectoring involved, not to mention that the image is not actually changed since Lightroom applies changes non-destructively. Included with it are the usual documentation, support, and tutorials. Adobe also released an updated version of Lightroom 5. The interviews you hear are done by professionals and the ones you see are certified instructors. We also get to see Neve (the creator of Lightroom) has not only stepped down as the company's key figure but has also only been involved in creating mostly simple and generic products like Lightroom and Photoshop. All the work that goes into these products has been done by others. The educational videos don't evolve to Flash video, either. But, other than that it seems like an important update.

On the other hand, Smite is less expensive than LoL, and many players prefer the faster paced casual experience it has to offer. The focus on quick gameplay and high player numbers as opposed to a lengthy and in-depth learning curve is probably why Smite has become the multiplayer gaming juggernaut that it is today. But, what's the difference between Smite and Photoshop? As the heavy hitters in the Post-processing/Layout world, it would be hard to argue that Photoshop is not more powerful than Smite at this point. But, it's not about what's more powerful, it's about what does what better and in what context. From a tactical standpoint, Smite can be a very fun game. Like any game, it's improved by use and mastery of some of the basic elements of the game. It's definitely a game that you can use the learning curve of the combat and your heroes to your advantage and you will definitely make mistakes along the way. But, if you analyze your mistakes and learn from them so you improve your strategy, you will find yourself a much better player. There is often a cartoonish feel to Smite to it. The maps are often the size or resolution as you would expect for a children's cartoon. Some of the heroes, in particular the water serpent, can have some wild animations. But, if you take the time to learn the rest of the controls and the combat, you'll find that Smite is actually a very competitive game. You may also find it to be as addicting and intense as the casual MOBA games. 933d7f57e6
